1 Introduction

RETOUCH NEXUS aims to promote robust, integrated, sustainable, inclusive and upscalable water governance practices

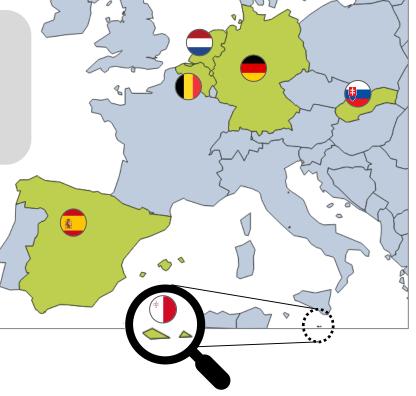

Figure 1: Location of the case studies with the RETOUCH Nexus project.

2 Research questions

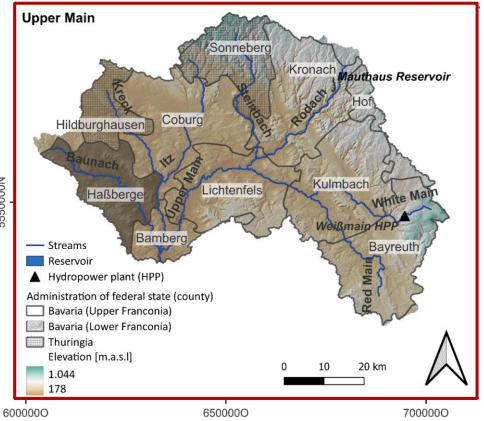

How to implement a weighted indicator based model framework for a sustainable climate- and socio-economic resilient water governance for the Upper Main Catchment using the SWAT+ and WEAP model?
1.1. Which indicators based on WEFE und ESS can be derived using the SWAT+ and WEAP models?
1.2. How do the stakeholders weight the indicators provided?

1.3. What conditions prevail in the Upper Main catchment when the model framework is applied?

2. What are the results of using the weighted indicator based model framework in combination with climate change and socio-economic scenarios within the Upper Main catchment?

3. How can the weighted indicator based model framework contribute as a decision/planning framework to develop adaptation strategies to CC and SE scenarios within the Upper Main catchment?

3.1 Study area – Location

- Catchment area: 4.646 km²
- **Elevation:**
 - east-west slope
 - [178, 1044] m.a.s.l.
 - ~ 75% located [178,500] m.a.s.l. ٠

River network:

- Upper main has two springs:
 - White Main
 - Red Main
- several tributaries ٠
- Mauthaus reservoir
- Weißmain Hydro Powerplant _

Figure 2: Location of the Upper Main catchment.

5550000N

3.2 Study area – Land use

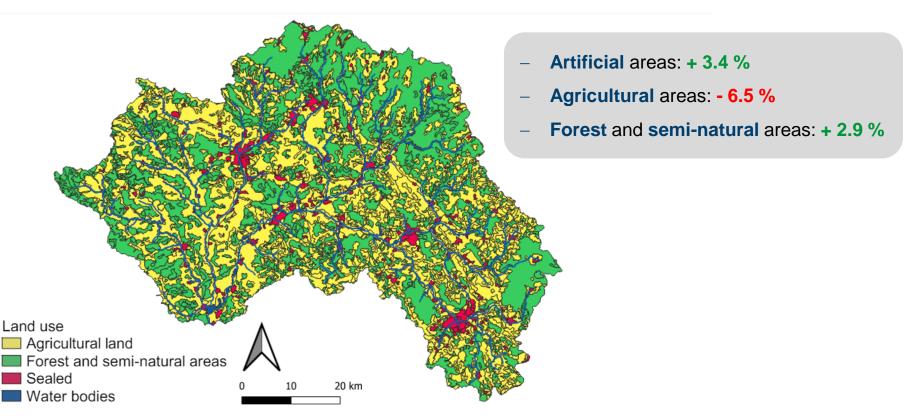

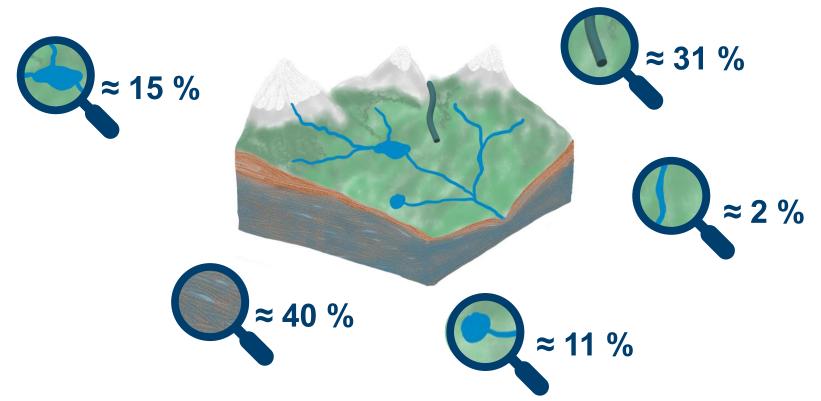

Figure 3: Land use change from 2000 to 2018 (CORINE Land Cover).

3.3 Study area – Water management

3.3 Study area – Flow regime

_

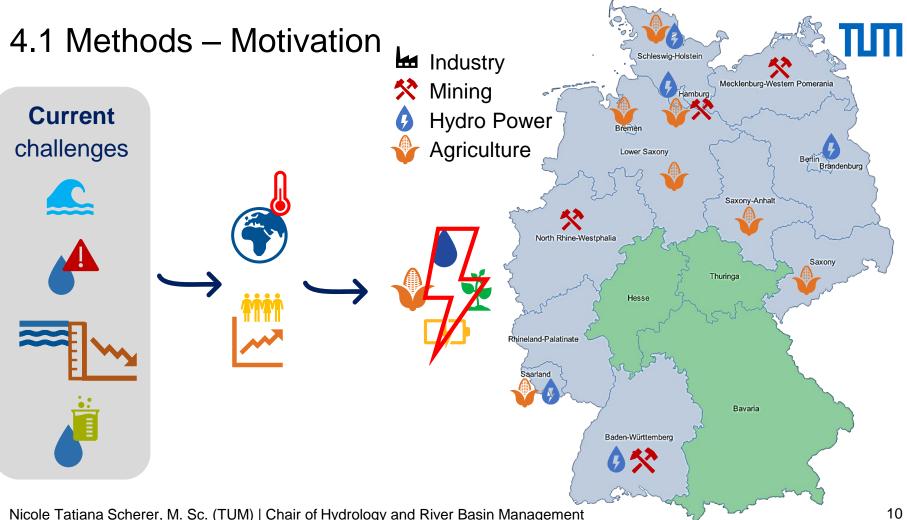

_

100 water bodies are mainly fed by rainwater 80 Precipitation [mm] summer season: 60 high $ET \rightarrow lower discharges$ 40 winter and early spring: 20 higher discharges 0 March ⁴Dril.

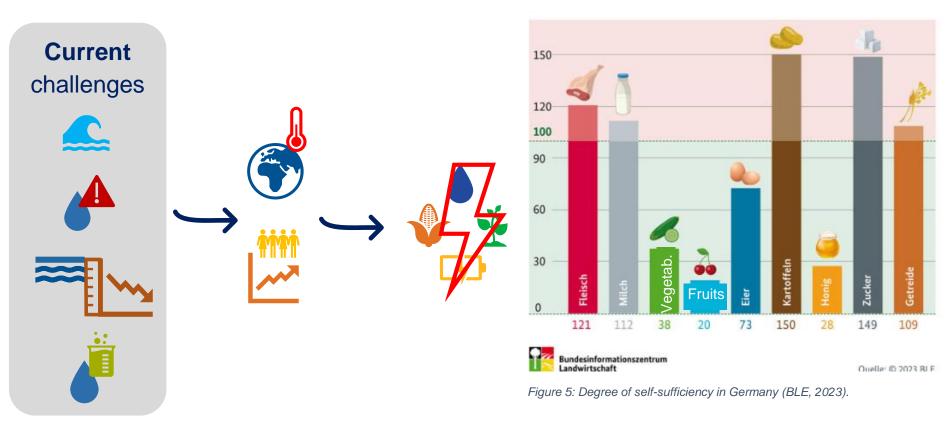

Q_{winter} (64.2 [m³/s]) Pmonthly Q_{summer} (23.3 [m³/s]) *Q*monthly Qyearly (43.6 [m³/s]) Flow regime at gauge Kemmern (1993-2022) 100 80 Discharge [m³/s] 60 40 20 0 Januar, September + November . December February. August October . (n)e 3 1ºh Month

Figure 4: Flow regime of the Upper Main catchment (gauge Kemmern) within the period from 1993 to 2022.

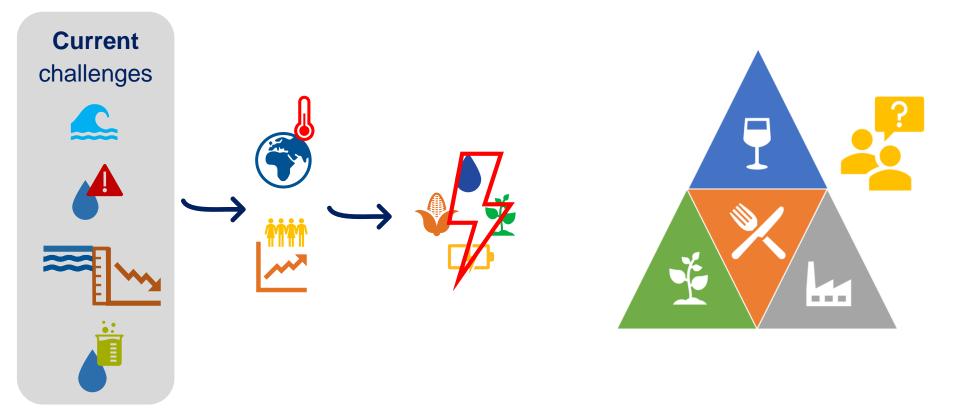

4.1 Methods – Motivation

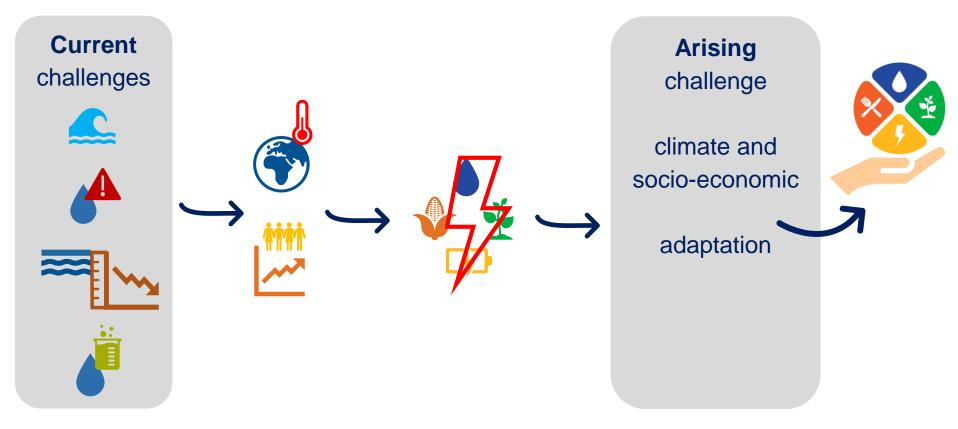

4.1 Methods – Motivation

4.1 Methods – Motivation

4.2 Methods – Model framework

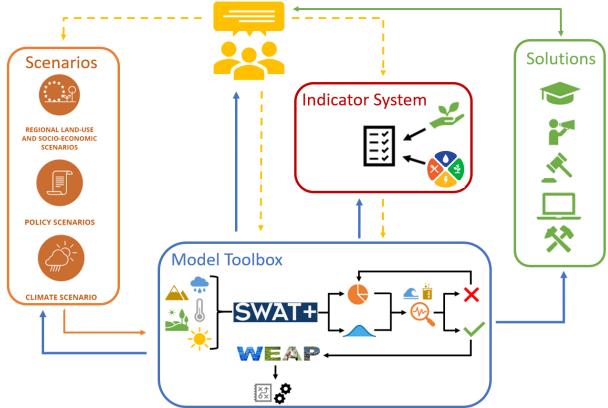

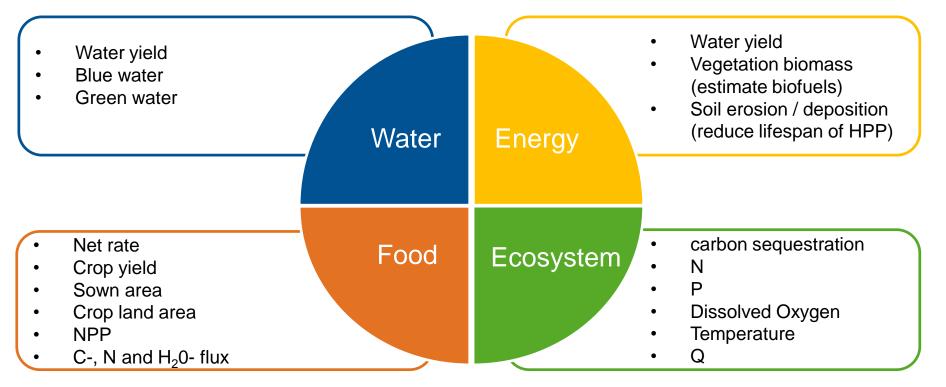

Figure 6: Overview of model framework used for the Upper Main catchment.

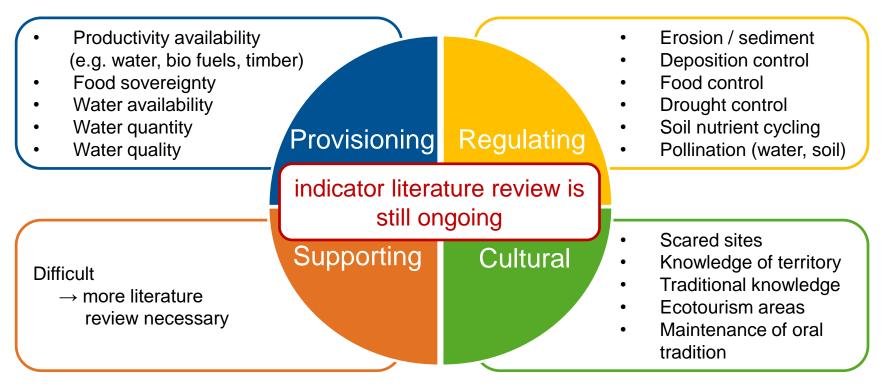

4.3 Methods – Indicators (WEFE)

4.3 Methods – Indicators (ESS)

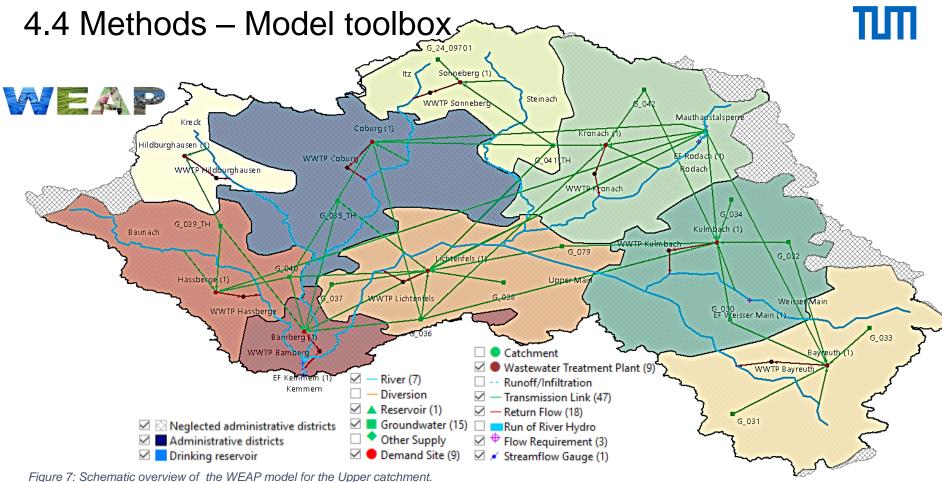

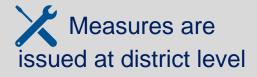

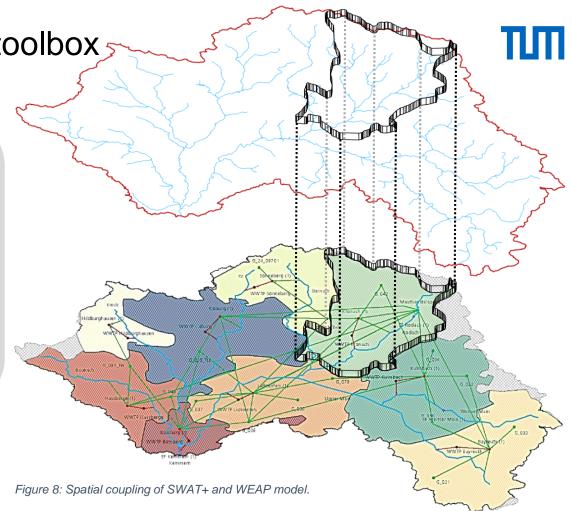

Figure 7. Schematic overview of the WEAP model for the Opper catchment.

4.4 Methods – Model toolbox

Why on district level?

Water demand is available on district level

Blue and green water calculation in SWAT

GW = GWF + GWS = ET + SW

Figure 9: Schematic diagram of blue and green water components (Hordofa et. al. 2023).

Where, GWF is green water flow and GWS is green water storage. GS is the difference between total amount of water recharge to aquifers (GW_RCHG) and the amount of water from aquifer that contributes to the main channel flow (BF) (Veettil and Mishra 2016). Nicole Tatjana Scherer, M. Sc. (TUM) | Chair of Hydrology and River Basin Management

BW = WY + GS
